

Schletter Configurator

Web-connected software

- Including Schletter catalogue
- Individual calculation
- Incl. structural analysis as part of our offer!

The Schletter Configurator has access to a wind and snow load data bank with information from 102 countries. Moreover, projects can now be uploaded and filed. Apart from that, the program desktop (navigation) has been updated.

In order to generate a virtual 2D top view, just arrange the modules of your choice with a suitable Schletter fastening system on the pitched roof, as far as this is structurally possible. The Schletter Configurator displays the capacity utilisation for each profile and fastener selected, taking structurally relevant dimensions into account. A piece list of the required components is then automatically generated. Besides standard pitched roof systems, also solar plants on flat roofs can be planned or individual structural calculations for Schletter profiles and fastening systems can be carried out. Thus, you can easily create a piece list including a structural analysis or order directly from Schletter GmbH by only one click in the Schletter web shop.

At this point, our software for calculations and the creation of piece lists is limited to our proven Alugrid system. All further Schletter systems will be uploaded into the program one by one by free updates.

System requirements

- Windows operating system
- NET framework 4 or higher
- about 100 MB free hard disc storage space

An internet connection is required to use the software

Recommendations

- Windows 7 or newer version
- Up-to-date browser
